

Amendments to the Specification

Please replace the paragraph beginning at page 15, line 2 with the following amended paragraph:

Though the incident location of a reference beam on the first lens 216 is altered by changing the position of the transmission region 206b of the iris 206 by way of driving the first actuator 208 connected to the iris 206 in the preferred embodiment of the present invention, it is also possible that the incident location of the reference beam on the first lens 216 is changed by moving the iris 206 and the first reflection mirror 210, with the second actuator 214' being connected to the first reflection mirror 210 ~~instead of the second reflection mirror 212~~. In such case, the first reflection mirror 210 is moved with an incident angle of the reduced reference beam toward the first reflection mirror 210 being unchanged.
